

# SMART INDIA HACKATHON 2024

**Problem Statement ID - SIH1620**

**Problem Statement Title -** Queuing models in OPDs/ availability of beds/ admission of patients. A hospital based solution is ideal which can be integrated with city wide module.

**Theme-** Medtech/Biotech/Healthtech

**PS Category-** Software

**Team ID-** TM001

**Anveshak\_1**

- To encounter this problem we are using 3 portals.

## PATIENT PORTAL :

- The Patient Portal is secure and personalized online space for patients.
- Allows patients to manage their health details, book appointments and view Live Queue status.

## HOSPITAL ADMIN PORTAL :

- The Administrative Portal will be managed by hospitals.
- Allows hospitals to manage patient records, track staff activities, analyze utilization of the resources and many more.

## DOCTOR PORTAL :

- The Doctor Portal allows doctors to manage their daily schedules, monitor patient queues, track tokens, and review appointment history.
- It makes doctors' workflows more efficient and helps elevate the standard of the patient care.

- Innovation and uniqueness of the solution

### 1 Online Appointments in OPDs

- Allows patients to book an online appointment in OPDs of the hospitals.
- It tackles the overcrowding issues which minimizes the waiting area congestion.

### 2 Automated Token Generation

- Generates a token number upon confirm booking of an appointment.

### 3 Live Queue System

- Patients can track their position in queue and the expected wait time.
- Notifies patients when the queue moves forward.

### 4 City-Wide Integration

- Integrated with city-wide hospital networks.
- Allowing users to access real-time information across multiple hospitals.

## Tech stack

### Algorithm Development:

Express.js & Golang - Core technologies used for developing the Queue Management Algorithm.

### Encryption and Security:

Custom encryption algorithm powered by 8 layer octa 512 bit encryption for secure data transmission and authentication.

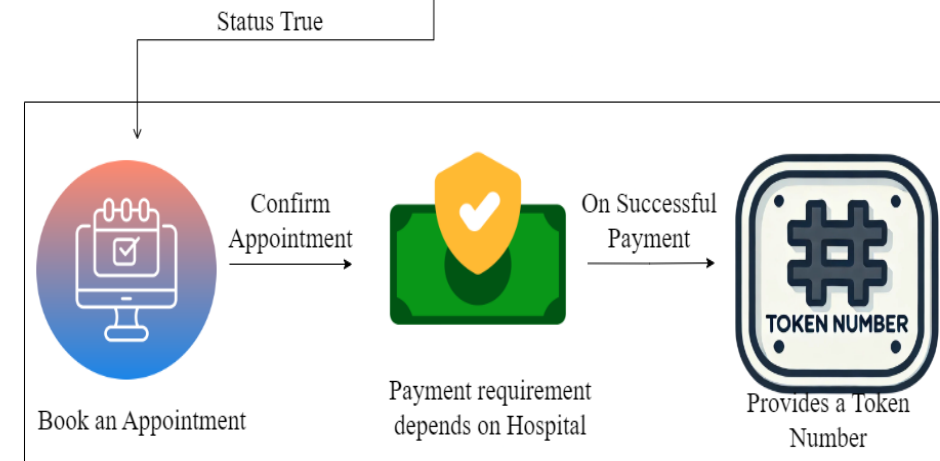

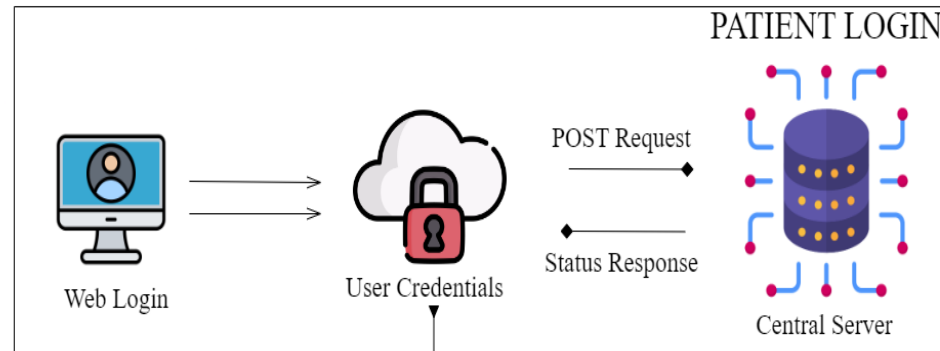

### Front-End Development:

HTML, CSS3 & Javascript - Technologies used to create an interactive and responsive GUI.

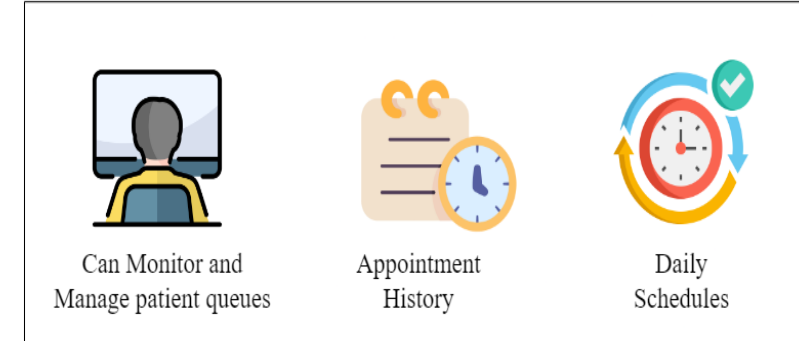

### Cloud Services:

MongoDB & Redis - NoSQL Database Management System.

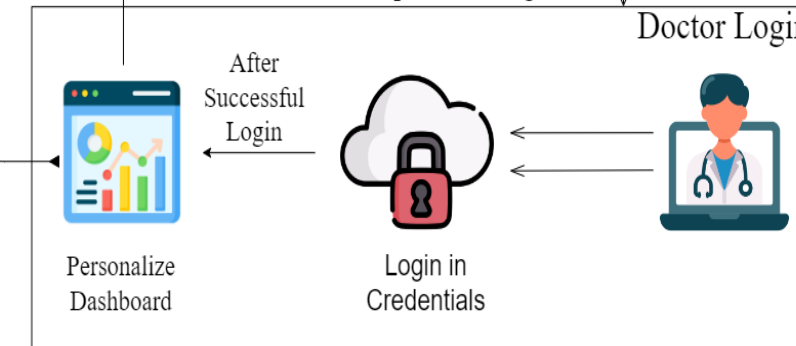

## Patient

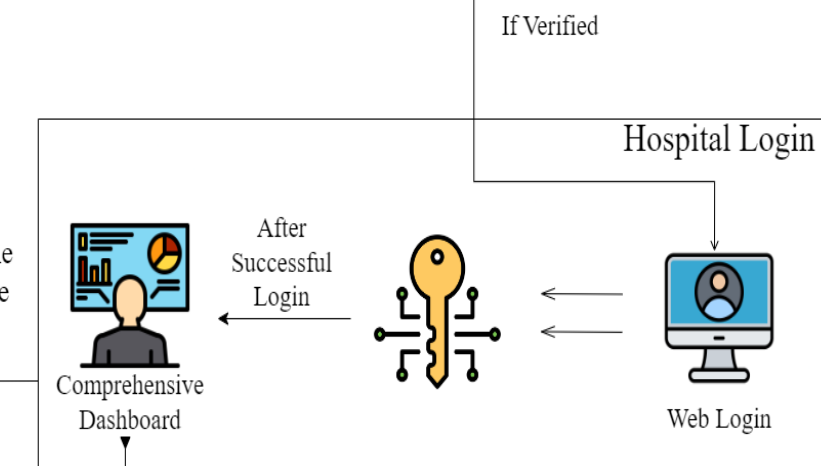

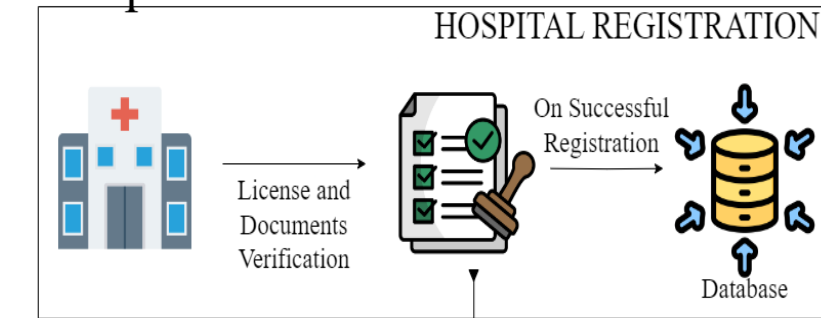

### Features of Doctors' Dashboard

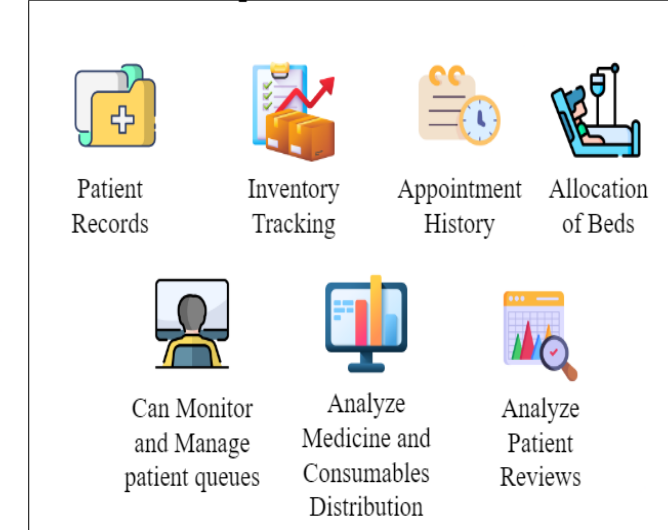

## Doctor

## Hospital Admin

### Features of Hospital Admin Dashboard

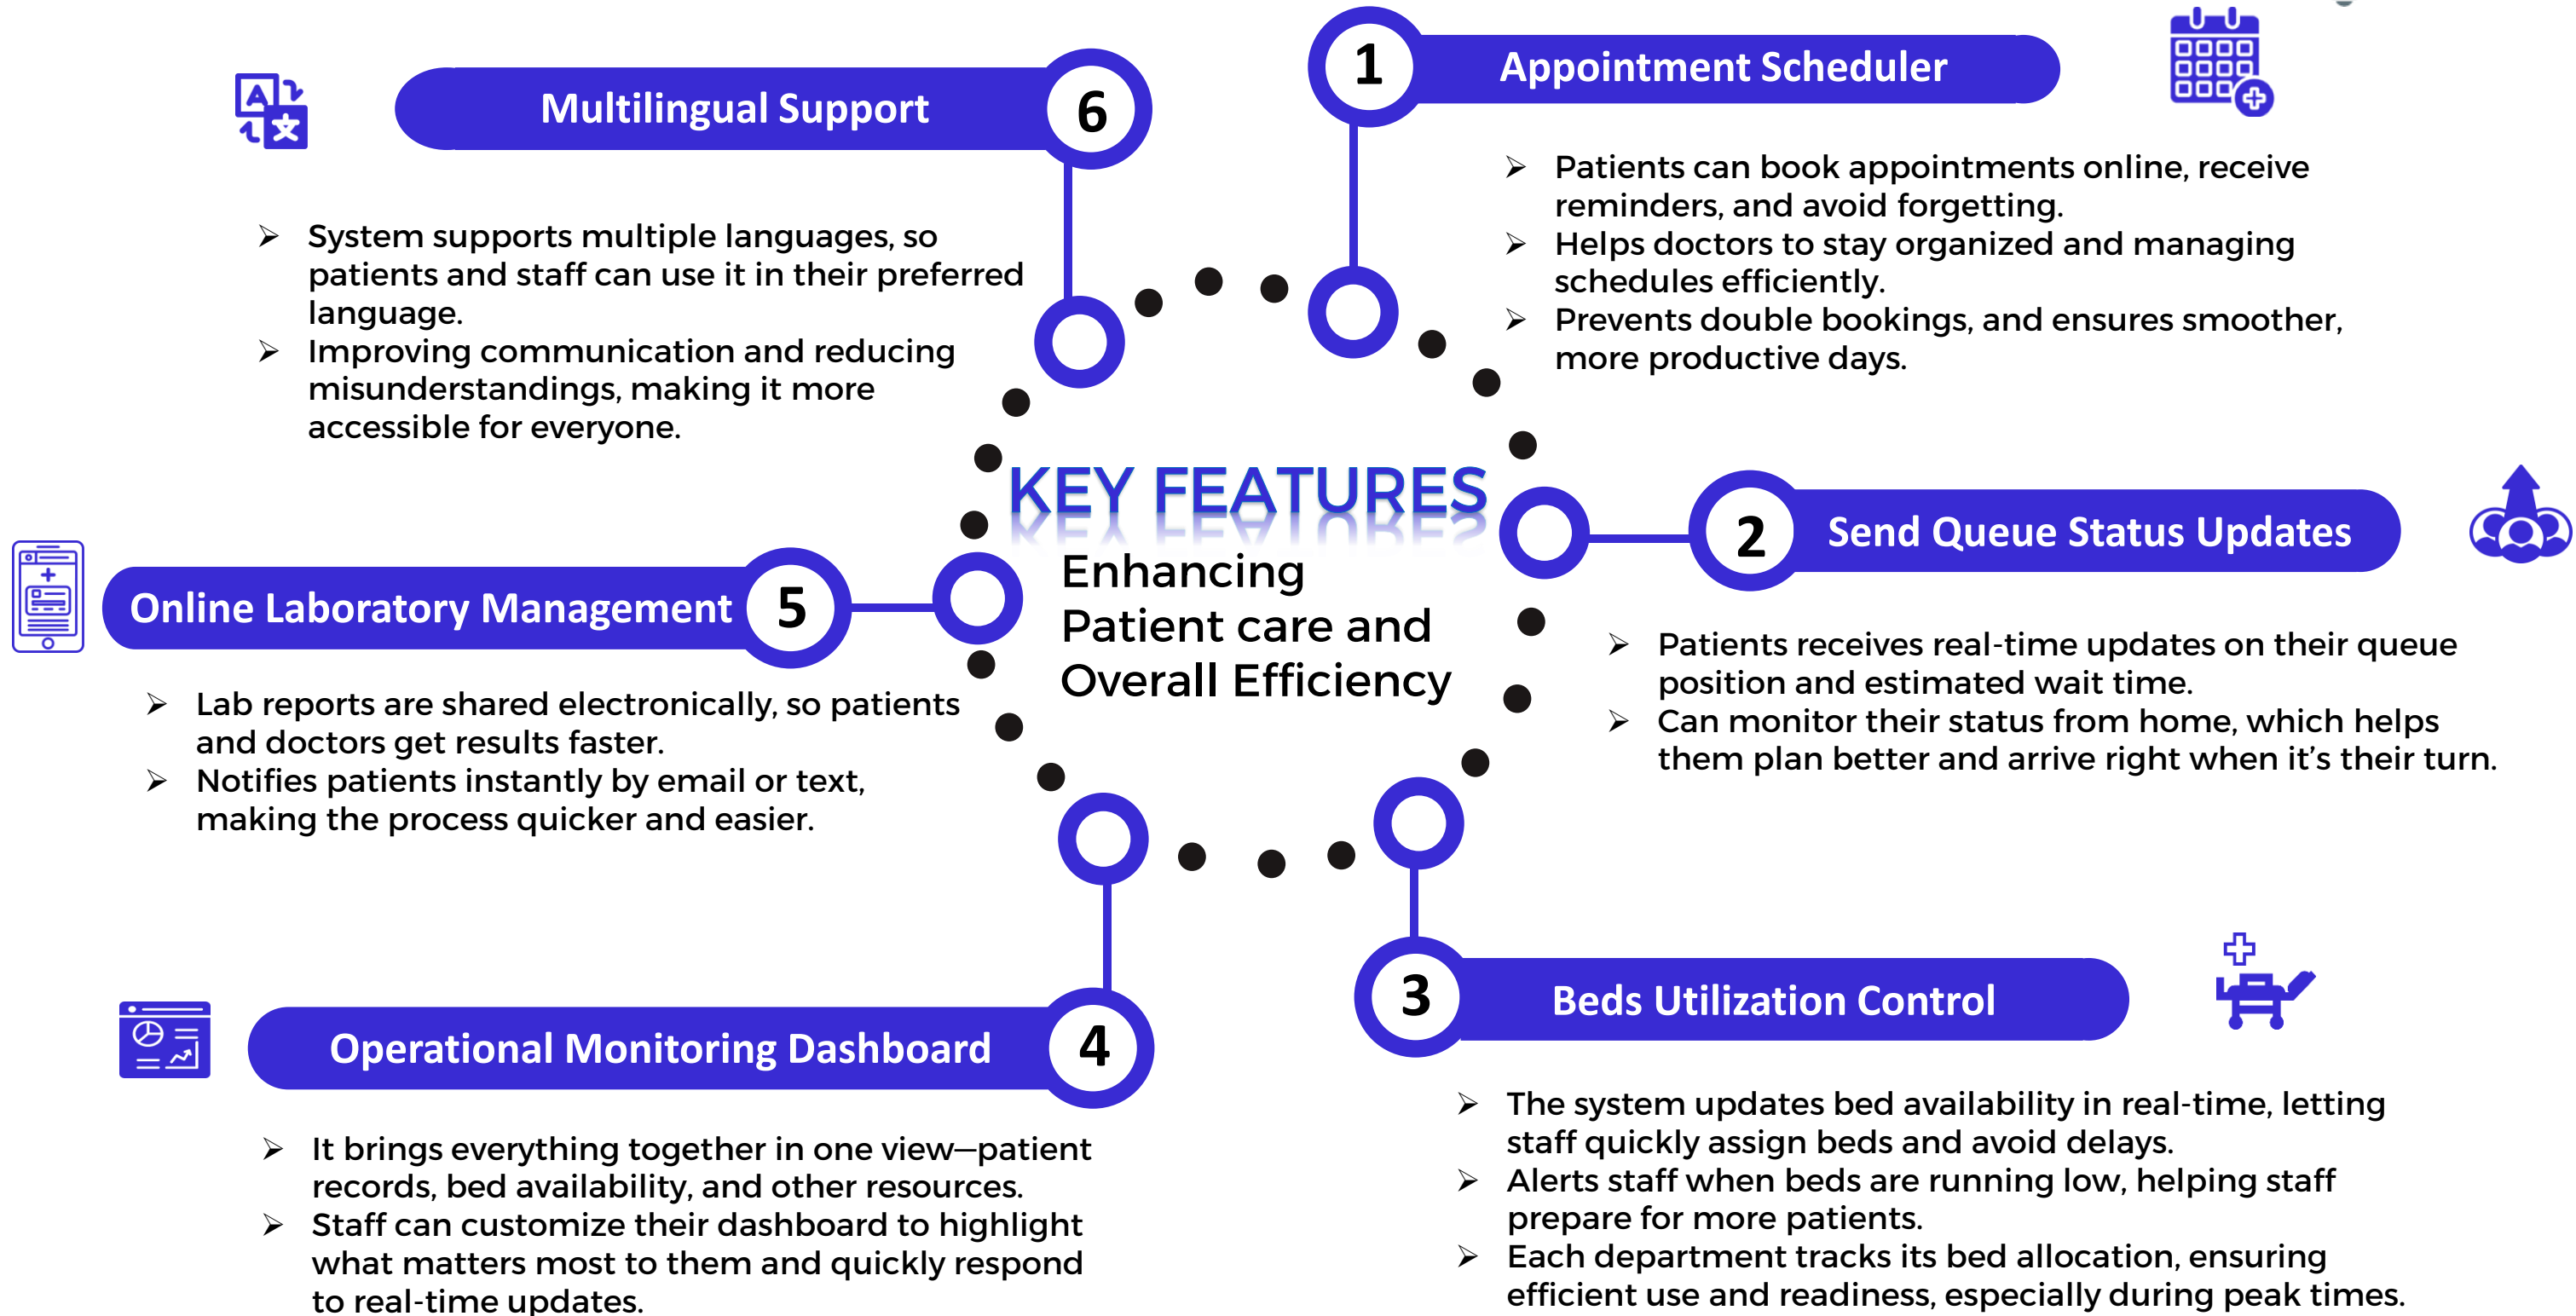

**Patients List**

PATIENT NAME	TOKEN ID	PROCEDURE	CHECKMARK
Patel Fairly Pending	PF1113	✓	○
Toder Pending	PT1113	✓	○
Patel, Mavil Pending	PM1113	✓	○
Patel Margi In Treatment	PM12	✓	●
Patel Margi In treatment	PM12	✓	●
Patadiya Smit Completed	PS111	✓	○
Patadiya Smit Completed	PS111	✓	○
Patadiya Smit, PS611 Completed	PS111	✓	●
Patadiya Smit, PS111 Completed	PS111	✓	●
Patel Mari Completed	PS111	✓	●
Patel Smit Completed	PS11	✓	●

Doctors Updates the Status of the Queue

Patients can see their status in the Queue

Only Doctors of the affiliated Hospitals can log in

## Operational Feasibility

Should the hospital implement the proposed solution to streamline patient admissions and add availability?

### Implement

System for the real time data analytics and queuing /centralized model.

### By making changes

Continue with current manual processes

## Technical Feasibility

### Key Technologies

Data Analytics  
Secure APIs  
Interoperability

### System Reliability and Performance

Performance Metrics  
System Uptime

Technical Feasibility

### IT Infrastructure

Cloud Computing  
Data Storage

### Scalable Web Platform

User Interactions  
Data Handling

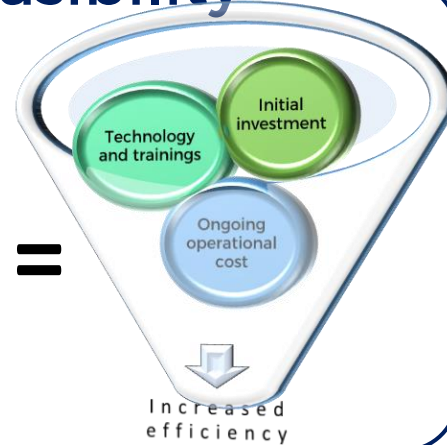

## Economic Feasibility

Reduced patient wait times

Improved resource allocation

Significant cost savings

## VIABILITY

**Transparency:** log details of the hospital is transparent.

**Market demands:** Managing OPDs queues, bed availability and inventory.

**Scalability:** Easy implementation in various healthcare systems.

## CHALLENGES

Data Security and Privacy

User Authentication and Access Control

Handling High Availability and Disaster Recovery

### Solution

- Implementing strong encryption both in transit and at rest to secure data.
- SSL/TLS (Secure Sockets Layer/Transport Layer Security).

### Solution

- Designing role-based access control (RBAC) to ensure that users only access the information and features relevant to their role.

### Solution

- Implement redundancy and failover mechanisms for continuous uptime.
- Develop a disaster recovery plan with regular backups and rapid restoration.
- Regularly test disaster recovery procedures to maintain preparedness.

## Patients

- ✓ Easier Appointment Booking
- ✓ Reduced Wait Times
- ✓ Convenient Access to Records
- ✓ Transparency on Availability

## Healthcare Providers

- ✓ Streamlined Operations
- ✓ Better Resource Management
- ✓ Improved Patient Flow

## Administratives

- ✓ Data-Driven Decisions
- ✓ Cost Savings
- ✓ Enhanced Satisfaction

## ECONOMIC

- ✓ Operational Cost Savings
- ✓ Reduced Resource Needs
- ✓ Patient Cost Savings
- ✓ Productivity Gains
- ✓ Scalable System

## SOCIAL

- ✓ Increased Healthcare Access
- ✓ Improved Patient Experience
- ✓ Safer Hospital Environment
- ✓ Inclusive Services
